

Health First — Week 2 Submission

Prototype Design & Development • Qutuhah InnovateX 2.0

1. Solution Design

Health First gives the user a daily list of health goals — drinking water, exercising, sleeping on time, and eating fruit. Missed goals trigger an alarm reminder. Games and other apps stay locked until every goal for the day is verified.

Verification happens two ways: uploading a photo, or asking a parent to confirm on the spot with a secret PIN. For real emergencies, a parent can unlock the device from their own dashboard using the same PIN.

2. Key Features (MVP)

- Daily goal checklist — water, exercise, sleep, fruit
- Reminder alarm for goals not yet completed
- App-lock simulation — games/YouTube unlock only once all goals are verified
- Two-path proof: photo upload, or parent PIN confirmation
- Parent dashboard with PIN-gated emergency unlock
- Streak tracker to reinforce consistency over time

3. How It Uses Technology

App: Cross-platform mobile app is the primary interface — daily checklist, reminders, camera capture, and the lock/unlock state for other apps.

Data: Every completed and missed goal is logged, building a per-day and per-goal history. This powers the streak counter and gives parents a progress view over time.

AI (current): A lightweight image check on the uploaded proof photo adds a first layer of verification alongside parent PIN confirmation.

AI (next): Pattern detection on logged data to adjust reminder timing and suggest new goals based on completion history.

4. Working Prototype — Screens

Below are live screenshots from the built prototype, demonstrating the full loop described above.

Kid View — Daily Goal Checklist

The kid sees today's four goals, an unlock progress banner, and a friendly garden buddy that reacts to progress.

Proof Submission — Photo Method

Tapping a goal opens the proof screen. The Photo tab lets the kid attach picture evidence, sent to the parent queue for review.

Proof Submission — Parent PIN Method

The PIN tab lets a parent confirm on the spot with a secret 4-digit PIN, approving the goal immediately.

Parent Dashboard

Parents review only goals submitted via photo. Nothing appears here until the kid actually submits proof.

Emergency Unlock

A parent-only PIN-gated control to unlock all apps immediately for genuine emergencies, bypassing the day's goals.

5. Research & Validation

- Family interview: family members confirmed they also forget daily health goals, showing this is a habit-formation problem, not just a kid problem.
- Concept sketch: hand-drawn flow of the checklist, alarm, and locked-phone concept, used to pressure-test the idea before building.
- Working demo built: the screens above, covering the full loop end to end.

6. Success Metric

Percentage of days per week where all four goals are completed and verified before entertainment apps unlock, tracked as a rolling streak.
